

COMPETITIVE SUPPLY SERVICE

CONSUMER INFORMATION ABOUT YOUR ELECTRICITY SUPPLY

November 2023

Electricity suppliers in Maine must, by Maine law, provide fact sheets, or “uniform disclosure labels” from time to time to educate consumers about their electricity service. Your electricity is delivered by the utility (Central Maine Power or Emera-Maine), but the electricity itself is supplied by:

Constellation NewEnergy, Inc.

This fact sheet provides consumer information about the power sources and air emissions provided by this electricity supplier.

Power Sources

(January 1, 2022 – December 31, 2022)

This supplier provided electricity with the following resources:

	<u>Supplier's Mix</u>	<u>New England Mix</u>
Biomass	13.1%	2.5%
Coal	0.2%	0.3%
Diesel	0.9%	1.5%
Efficient Resource	0.0%	0.1%
Fossil Fuel Cogeneration	0.0%	0.0%
Fuel Cells	0.0%	0.6%
Geothermal	0.0%	0.0%
Hydro	39.8%	6.1%
Jet	0.0%	0.0%
Municipal Waste	4.7%	0.6%
Natural Gas	28.1%	45.6%
Nuclear	2.0%	24.5%
Oil	3.2%	4.9%
Solar	0.2%	6.4%
System Mix	7.7%	0.4%
Tidal	0.0%	0.0%
Trash-To Energy	0.0%	2.1%
Wind	0.0%	3.5%
Wood	0.0%	0.8%
TOTAL	100.0%	100.0%

Air Emissions

(January 1, 2022 – December 31, 2022)

This table compares air emissions from this supplier's electricity mix to average emission levels from all New England power sources.

	<u>Supplier's Mix</u> (lbs/MWh)	
Carbon Dioxide (CO₂)	1169.37	This is 158.4% more than the New England Average.
Nitrogen Oxide (NO_x)	121.69*	This is 772.0% more than the New England Average.
Sulfur Dioxide (SO₂)	0.51	This is 124.0% more than the New England Average.

Notes: lbs/MWh = pounds per Megawatt-hour
1 Megawatt-hour = 1,000 kilowatt-hours

*Q3 2022 NEPOOL reported residual mix nitrogen oxide number was 574.97, which was materially higher (>1) than was reported in previous reporting periods. Part of Constellation's emissions number is based off the NEPOOL number, so this probable data entry error impacted Constellation's numbers.

Additional Information and Required Notes:

- Notes:**
- Power Sources**—Maine law requires retail electricity providers to supply no less than 30% of their total annual kilowatt-hour sales with electric energy generated from eligible resources. Either a renewable fuel or an efficient process, such as co-generation, must be used to generate the electricity used to satisfy this requirement. Co-generation sometimes uses fossil fuels, such as gas, coal or oil, and is considered to be efficient because the process yields both electricity and thermal energy.
- Emissions**—**Carbon Dioxide (CO₂)** is released when certain fuels are burned. It is considered a greenhouse gas and a major contributor to global warming. **Nitrogen Oxides (NO_x)** form when certain fuels are burned at high temperatures. They are considered contributors to acid rain and ground-level ozone (or smog). **Sulfur Dioxide (SO₂)** is formed when fuels containing sulfur are burned. Major health effects associated with SO₂ include asthma, respiratory illness and aggravation of existing cardiovascular disease. The production of electricity can produce other harmful emissions and have other environmental impacts. Environmental impacts differ among individual power plants.

If you have questions or need further explanation, please contact Constellation NewEnergy, Inc. toll-free at 1-844-636-3749 or the Maine Public Utilities Commission, toll-free, at 1-800-452-4699. Additional information can also be found at <http://www.maine.gov/mpuc>
